

Human Movement Sciences: Sport, Exercise and Health (MSc)

Vrije Universiteit Amsterdam - Faculteit der Bewegingswetenschappen - M Human Movement Sciences - 2015-2016

The one-year (60EC) programme Human Movement Sciences: Sport, Exercise & Health aims to teach students to collect and develop knowledge and understanding of human movement and to be able to apply this in the sports-, exercise- and health-related fields. The programme comprises four main tracks: biophysics in health & rehabilitation; health & lifestyle interventions; physiology in sport & health; and sport psychology. Given the nature of the study, exercise will form a key part of all tracks. The tracks are not strictly divided programmes and overlaps and switches to compose the ideal programme for each individual student are absolutely possible.

Next to the four tracks, the programme offers a limited number of students (we have approximately 15 -20 places available each year), the opportunity to acquire an accreditation for teaching in Higher Education. The programme "Teaching in Higher Education" amounts to 24 EC, which can partially be incorporated into the regular programme. The programme also intends to establish links to certifications in health and exercise such as those the recognized certifications of the American College of Sports Medicine (Registered Clinical Exercise Physiologist®, Exercise Specialist® (ES) en ACSM Health/Fitness Instructor®).

The MSc diploma, when combined with a small number of additional courses will allow students access to the Postgraduate programme for Practical Sports Psychologist. This Postgraduate programme will take approximately one year (full time) and leads to accreditation as "Sportpsycholoog Vereniging voor Sportpsychologie in Nederland (r)"

Overview of the programme

(For more information about the courses, please see below)

Admission to the Master's programme

Students with a bachelor's degree in Human Movement Sciences (either from VU University or the RUG) or Health Sciences with a major Human Movement Sciences (UM) or Medical Sciences with a major Human Movement Sciences (Radboud Universiteit) have direct access to the master's programme HMS.

The only condition is that the student has made a rough personal planning for the Master's Programme that has been approved by the Examination Board. Bachelors of studies other than Human Movement Sciences need to meet the requirements as mentioned on the [website](#).

The Master's Programme only starts in September. Students from both our own Bachelor's programme and from other programmes are not allowed to start the Master's programme during the academic year.

Master Programme for students with a Bachelor degree other than Human Movement Sciences

For detailed information on admission requirements and procedures for students with a Bachelor degree other than Human Movement Sciences wanting to follow the Master's Programme, we refer to this [website](#).

The Master's Programme for these students normally is consistent with the regular Master's Programme.

Most students from other programmes than Human Movement Sciences have to follow a Premaster's Programme before entering the Master's Programme. Depending on the nature of the Bachelor degree of the student, the elements of the Premaster Programme are determined. The study load for the Premaster Programme may vary from 6 to a maximum of 30 credits. If more than 30 credits are required for admission to the Master's programme, students have to follow a maximum of two courses (12 credits) extra. A special fee of 63,50 euro per credit is charged for these additional courses.

Optional courses

The student can use the Optional credits for:

- Following one or more master courses of the other track or optional courses within the programme, or selected courses from the Research Master's Programme (note: entry for these courses might be limited);
- Courses from the Bachelor's programme, provided that the total programme comprises at least 51 EC from the master's programme.
- Elements of other master's programmes, either of VU University or another University, provided that the total programme comprises at least 51 EC from the master's programme.
- Following a Teacher Training Course. Please note that because the Teacher Training Course is 24 EC, it will result in an extended duration of the study. See www.fbw.vu.nl for the Teacher Training Course.
- Participation in one of the SOCRATES-Programmes: Exercise and Sport Psychology, Adapted Physical Activity or Development of Motor Control and Coordination. This will probably lead to extended study duration as well. It is possible that more opportunities will be present in the near future. For more information contact international-and/or

master coordinator.

-Short-literature review of 6 EC.

-Extension of the internship with 6 credits (total 30 credits).

-Practical internship of 6 EC.

The student submits his free choice elements formally to the Examination Board by means of an approval form. The approval form must be signed by the study advisor.

Approval Form

Although the students are free in choosing elements for the Optional credits, the faculty has certain requirements as to the size and the level of the chosen elements. The Free Subject Choice should, in theory, only consist of study components from the Master's programme. Study components from the Bachelor's programme for the Free Subject Choice are only applicable when they are relevant to the Master's programme. In order to establish this, the student needs to fill out the [Approval Form](#) with the element content and rough planning, which has to be signed by the study advisor for approval. In order to prevent disappointments we advise the students to hand in their Approval Forms as early as possible.

Docent(en)	prof. dr. H.E.J. Veeger, prof. dr. J. Harlaar
Lesmethode(n)	Hoorcollege, Computerpracticum

Doel vak

The student is capable to:

- Define and calculate local joint coordinate systems;
- use and understand different calibration methods and their limitations;
- translate technical motion descriptions into clinically relevant units;
- apply the above to experimental data;
- interpret and comment on methods as described in the literature.

Inhoud vak

In this course students are introduced to the fundamentals of three-dimensional kinematics, as well as the (more or less) standard application methods.

The course will comprise three separate blocks focusing on

1. the definition and use of local coordinate systems in the calculation of osteokinematics;
2. the use of technical marker sets as well as the practical implications of data processing, especially correcting for missing markers and;
3. the calculation procedures for obtaining helical axes, needed for the definition of functional axes-based coordinate systems

Onderwijsvorm

Lectures, computer practicals and tutorials

The three computer practicals are linked to in-term assessments. Each practical will contribute for 15% to the final score.

Toetsvorm

- completion of all 3 assignments is mandatory to qualify for the exam
 - two in-term tests on calculation skills, partially exempting for exam
 - final test on calculation skills + literature
 - score: 3 x 20% for calculation questions (one for each block)
- 40% for essay question
above 100% = 9/10

Literatuur

Relevant papers will be listed in Blackboard.

A useful source is the book by Zatsiorsky (Zatsiorsky, Valdimir M., Kinematics of Human Motion. Champaign, Illinois: Human Kinetics, 1st edition, 1998. ISBN 0-880110767-5), which will be used as reference material.

Vereiste voorkennis

This course requires proficiency in Matlab and matrix calculation. If there is a deficiency related to Matlab skills, students are strongly advised to take the TUE web-based matlab course that can be found at <http://www.imc.tue.nl/>

The BSc course "Mechanische Analyse ..." is advised.

Overige informatie

The maximum number of participants in this course is limited to 40.

Applied Biomechanics

Vakcode	B_APPLBIOMECC ()
Periode	Periode 2
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. S.M. Bruijn
Examinator	dr. S.M. Bruijn
Docent(en)	dr. G.S. Faber, dr. S.M. Bruijn
Lesmethode(n)	Hoorcollege, Computerpracticum
Niveau	500

Doel vak

In this course the student will upgrade their mostly 2D biomechanical knowledge to the 3D world and they will learn to apply this new knowledge to perform biomechanical analyses in the context of Sport and Health. Examples of concepts included are joint angles, joint moments, energy (work, power), angular (and linear) momentum.

Students will learn to analyze laboratory measurements using a 3D inverse dynamics model. Furthermore, they will learn how to work with more simple measurement techniques, such as accelerometers found in phones. You will also learn how these complex and simple measurement tools can be applied in biomechanical research in both the laboratory and the field settings. Lastly, you will learn to think about what measurements are sufficient for a given problem; in other words; what are the most efficient ways to solve your problem, and at what cost (i.e. decrease in precision) does this come?

Inhoud vak

Every week consists of lectures, Matlab practicals. During the lectures the theory will be explained. During the Matlab practicals, the biomechanical theory will be applied to analyze different applied research questions. In the last weeks of the course, you will start working on a research proposal to combine the things you've learned over the course. During the penultimate week, there will be a personalized feedback moment for these project proposals.

All content will be targeted on hands-on applied biomechanical questions as examples for the theory to be studied; examples of questions studied are; What is the ankle load during a basketball jump landing? Is squat lifting really better for your back? How come field hockey players can give so much speed to a ball during a drag flick? How can gymnasts improve their jumps? How can we use mobile phones to gather meaningful data about human movement?

Every week, the motion to be analyzed will become more complex (few segments à full-body).

Measurement using the following systems will be covered in this course:

- Laboratory grade 3D motion registration (Optotrak, Force plate)
- A wearable multi-inertial sensor suit for 3D full body motion capture
- Simple wearable accelerometers
- Mobile phones
- Kinect (demo)

Onderwijsvorm

21 hours of Lectures

48 hours of practicals

90 hours of self-study (preparing lectures, Writing assignments etc)

Toetsvorm

Weekly practical report + research proposal

Literatuur

Will appear on blackboard

Vereiste voorkennis

It is recommended, although not required, to have completed the following courses:

- Biomechanics
- Mechanische analyse van het menselijk bewegen (2D inverse dynamics)

If you did not take these courses, you should have at least some affinity with biomechanics. Furthermore, it is advisable to be familiar with Matlab since all biomechanical modeling will be done with this program.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Behavioral Concepts in Human Movement Sciences

Vakcode	B_BEHCONCEPT ()
Credits	3.0
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. J.B.J. Smeets
Examinator	prof. dr. J.B.J. Smeets
Docent(en)	prof. dr. P.J. Beek
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

The student is able to describe course aims in formal format, divided in the categories:

- reporting the key behavioral concepts in contemporary Human Movement Science;
- applying these concepts in describing research outcomes;
- judging the (dis)advantage of using a concept in a particular situation.

Inhoud vak

Human movement is a complex behavior. To interpret this complex behavior, the scientific literature uses concepts that are rather complex themselves. Examples of such concepts are information, stability, synergy, internal representation and motor programs. In this course, questions such as "What do these concepts mean exactly?" and "How do these concepts help us to understand the behavior we observe?" are be addressed.

Onderwijsvorm

8 two-hour lectures, 33 hour self-study, 28 hour essay writing s, 7 hour essay evaluation

The students prepare for the lecture by reading both papers and by writing a brief critical essay (maximum of 500 words) on one of them. Each essay will be evaluated by two randomly selected fellow-students (implying that, in the context of each lecture, each student will have to write one essay and score two essays). During the lecture the teachers then present their own evaluation of the papers in question, highlighting the theoretical background of a given concept and the manner in which it is defined and used in the study of interest. The evaluation by the teachers will assist the students in evaluating their own essay as well as their assessment of the quality of essays written by their peers. This cycle will repeat itself over the 7 concept-related lectures, allowing the students to develop their critical evaluation skills of key concepts used in the study of motor control and learning. Towards the end of the course, each student selects two of his or her own (most promising) essays to elaborate further into two final essays, which will then be scored by the teachers for final grading.

Toetsvorm

The grading of the two essays to be evaluated by the teachers will be based on the following weighted general aspects:

Language: spelling, grammar and style (20%)
 Clarity of insight in the theoretical context (20%)
 Clarity of insight in the concepts and their empirical elaboration (30%)
 Argumentation: to-the-pointedness, logic and persuaviness (30%)
 In order for the two final essays to be considered, all 7 essays and 14 evaluations should have been completed in time

Literatuur

Various scientific publications are be used, further information is provided during the course.

Vereiste voorkennis

No specific entry requirements.

Overige informatie

The two essays should each have a length of less than 1000 words

Clinical Exercise Physiology

Vakcode	B_CLINEXERC (900670)
Periode	Periode 3
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. J.J. de Koning
Examinator	prof. dr. C.C. Foster Jr.
Docent(en)	dr. J.J. de Koning
Lesmethode(n)	Hoorcollege, Practicum, Werkcollege
Niveau	400

Doel vak

To provide the student with the fundamental knowledge of clinical exercise physiology as a variant of normal exercise physiology, which will enable the student to apply this knowledge in preventive and rehabilitative exercise programs.

Inhoud vak

Basic didactic information and laboratory experiences of the effect of pathophysiological conditions on human energy metabolism and health. The focus will be on organ systems and their linkage to ATP generating pathways and on how this influences skeletal muscle performance. The application is to the use of exercise both diagnostically and as a therapeutic tool. After this course the student will have the fundamental knowledge and skills to use exercise in patients with cardiopulmonary/metabolic disease and to work cooperatively with other health care providers.

Onderwijsvorm

Lecture
Practical laboratory exercises
Directed reading

Toetsvorm

multiple choice

Literatuur

A selection of articles and practical guide on BlackBoard

Vereiste voorkennis

Toegepaste Inspanningsfysiologie.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Concepts in HMS

Vakcode	B_CONCEPTS ()
Periode	Periode 1
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. T.W.J. Janssen
Examinator	prof. dr. T.W.J. Janssen
Docent(en)	prof. dr. J.H. van Dieen, prof. dr. J.B.J. Smeets
Lesmethode(n)	Hoorcollege
Niveau	500

Doel vak

The student is able to report the key behavioral concepts in con-temporary HMS, to apply these concepts in describing research out-comes, and to judge the (dis)advantages of using a particular concept in a particular situation.

The student knows the mechanical concepts that apply to control of joint position and movement, in particular equilibrium, stability, robustness,

performance, and observability. The student understands these concepts and can explain how they are related to clinical problems and to motor control in patients with joint disorders.

The student knows the physiological concepts of exercise intensity and workload in sports and clinical research and training, in particular, (sub-) maximal force/power generation, (sub)maximal energy expenditure, an-aerobic threshold and critical power. The student understands these concepts and can explain how they are related to sports and rehabilitation research and practice.

Inhoud vak

In this course, the students are acquainted with biophysical and behavioural concepts that underlie current debates in HMS.

The first part of this course deals with behavioural concepts of HMS. Human movement is a complex behavior. To interpret this complex behavior, the scientific literature uses concepts that are rather complex themselves. Examples of such concepts are information, stability, synergy, internal representation and motor programs. In this course, questions such as "What do these concepts mean exactly?" and "How do these concepts help us to understand the behavior we observe?" will be addressed.

A second part of the course deals with biomechanical concepts in particular with (in-)stability of joints and joint movement. Instability is often used in the clinical setting to describe the state of the joint after injury or in degenerative disorders. The term is often poorly defined, which leads to confusion in the communication between disciplines, e.g. between physiotherapists and orthopedic surgeons. Mechanics and control theory provide a rigorous framework for describing joint function. The relevance of this conceptual framework for the clinical context and the implications for diagnosis and treatment will be discussed.

A third part of the course deals with physiological concepts in particular with the use of exercise intensity and relative workload. Relative workload is often used to induce similar loading of persons in sports and clinical studies, either to measure endurance or to induce a certain training stimulus. Relative workloads as percentage of maximal force/power or energy utilization (oxygen uptake) are used in various circumstances. While the choice for a given variable is essential for the result, it will be discussed whether the proper variables are chosen for the specific goals.

Onderwijsvorm

45 contact hours, divided in:

Lectures 21 * 2 hours

Exam 3 hours

115 hours self study

The course consists of 3 series of 7 lectures dealing with biomechanical, physiological, and behavioural concepts respectively. In the first lecture of each series a general introduction will be given. In subsequent lectures, the formal concepts will be introduced and explained and related to the applications in sports and health. In the 7th lecture of each series, questions by the students will be discussed.

Toetsvorm

Written test with open-ended questions, with equally weighted questions on the 3 parts of the course content.

Literatuur

Research articles, review papers and a syllabus will be made available at the start of the course.

Vereiste voorkennis

The student should have a basic knowledge and understanding of the human musculoskeletal anatomy as described for example in Human Anatomy. EN Marieb, J. Mallatt, Benjamin Cummings, 3rd edition, ISBN: 0-8053-5335-6, chapters 1.1-1.16; 4.88-4.102; 4.99-4.102; 9.212-9.239; 10.244-10.253; 11.266-11.270.

The student should have a basic knowledge and understanding of biomechanics as described for example in: Fundamentals of Biomechanics. Equilibrium, Motion and Deformation. M. Nordin and N. Ozkaya; Human Kinetics, ISBN 0387982833, chapters 1-5.

The student should have a basic knowledge and understanding of exercise and muscle physiology as described in for example W.D. McArdle, F.I. Katch, V.L. Katch: Exercise Physiology: energy, nutrition & human performance, 7th edition (2010) Lippincott Williams & Wilkins, ISBN 1608318591, chapters 7-11, 15-17, 21.

Coordination Dynamics: principles and applications

Vakcode	B_CLINCORDYN (900666)
Periode	Periode 2
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. M. Roerdink
Examinator	dr. M. Roerdink
Docent(en)	dr. M. Roerdink
Lesmethode(n)	Hoorcollege, Computerpracticum, Practicum, Bijeenkomst, Deeltoets extra zaalcapaciteit
Niveau	400

Doel vak

The coordination dynamics approach is pursued to study how patterns of coordinated movement come about, persist and change as a function task constraints, expertise and pathology. The student is acquainted with the key principles, concepts and methods of coordination dynamics. The student can explain these aspects in a qualitative manner. The student is able to indicate how these aspects may contribute to assessments and interventions in the context of sports and rehabilitation. The student can interpret scientific literature in the area of coordination dynamics. The student can design new basic or applied coordination dynamics experiments.

Inhoud vak

Coordination dynamics is governed on the one hand by principles of self-organization, and on the other hand by intentionality, perceptual information and explicit knowledge. Coordination patterns exist at multiple levels: 1. dynamics within or between body segments of a moving person; 2. dynamics between moving segments of multiple persons and 3. dynamics between person and external events, as well as between persons. Coordination dynamics provides a framework to study the nature of

pathological, normal and expert movements by assessing stability and loss of stability of coordination patterns as a function of training and rehabilitation.

The first part of the course provides an overview of the key principles, concepts and methods of coordination dynamics by adopting a 3-stage empirical approach: 1. gaining background theoretical information through lectures and literature, 2. gaining hands-one experience by participating in experiments, formulating hypotheses and analyzing the so-obtained data, 3. gaining a thorough understanding of the key aspects of coordination dynamics by linking theory and practice.

The second part of the course focuses on the application of coordination dynamics in sports and rehabilitation, again by adopting a 3-stage empirical approach. In the context of rehabilitation, specific emphasis will be placed on interventions based on environmental coupling aimed at facilitating desired coordination patterns and/or stabilizing existing unstable coordination patterns. In the context of sports, the nature of interactions between two or more athletes will be the focal point, including their cooperative and competitive effects on pattern formation and coordinative stability.

Onderwijsvorm

Amount of contact hours (36 hrs), divided in:

Lectures: 10 * 1.75 hrs

Laboratories: 2 * 2.00 hrs

Computer Practicals: 5 * 2.00 hrs

Midterm Exam: 1 * 1.75 hrs

Exam: 2.75 hrs

Self study: 132 hrs

Toetsvorm

Written closed-book exams with open-ended questions. The final grade is determined by both the Midterm Exam (25%) and the Final Exam (75%). However, in case the grade of the Midterm Exam is lower than that of the Final Exam, the final grade is fully determined by the Final Exam grade (i.e., Midterm Exam [0%], Final Exam [100%]).

Literatuur

A selection of relevant book chapters and articles.

Vereiste voorkennis

Basic understanding of statistics (What is a standard deviation?), sine waves (What is the amplitude, offset, frequency and phase?), integral and differential calculus (What is the derivative of a sine wave?) and Matlab (Can you run a script?). Please note that Matlab scripts and functions are provided and so programming skills are not required for the computer practicals. Computer practicals are included to become acquainted with the handling and interpretation of the experimental data and associated coordination dynamics outcome measures).

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Overige informatie

Note that Laboratory 2 will be held at the Duyvensz-Nagel Research Laboratory of Reade Center for Rehabilitation and Rheumatology (DNO, Reade, Overtoom 283). Students can subscribe for Laboratories and Computer Practicals on BlackBoard.

Current Issues in Sport and Exercise Psychology

Vakcode	B_CURRISSUES ()
Periode	Periode 1
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. R.I. Hutter
Examinator	dr. R.I. Hutter
Docent(en)	dr. R.I. Hutter, dr. R. Canal Bruland
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

The student is able to:

- outline the main findings from the sport and exercise psychology literature on the topics included in the course
- apply these theoretical findings to practical settings (the assignments include interviews, observations and analysis, intervention and questionnaire design)
- discuss practical findings from the assignments with peers and draw overall conclusions from these findings
- present practical findings from a sound theoretical basis.

Inhoud vak

In this course several important, current issues in both sport and exercise psychology are addressed. The course aims to provide in-depth information and to transfer this information to practical settings through different assignments.

The topics to be discussed are:

- Career development and transitions in sport
- Injury prevention and rehabilitation
- Clinical issues in sport psychology
- Ethical issues and moral behavior in sport
- Mechanisms of psychological outcomes of exercise behavior
- Intervention strategies for exercise promotion and exercise adherence

The course consists of two meetings per topic. For each topic, literature and review questions are provided. The students are required to study the literature and answer the review questions. In the first weeks the meetings consist of discussion of the review questions. In addition, for each topic a recent study on the topic is highlighted. Next, students work on practical assignments. In the last week of the course the findings of the practical assignments (from interviews, observations, measurements and analyses) are discussed, reviewed and presented.

Onderwijsvorm

Discussion meetings

Toetsvorm

Students hand in answers to the review questions (these are partly assessed, 40% of total grade), hand in one assignment (30%), and present one assignment with small groups (30%). All parts have to be scored

sufficient to pass.

Literatuur

- Course manual (Available on Blackboard);
- Recent articles and book chapters on sport and exercise psychology

Vereiste voorkennis

Students should have basic knowledge and understanding of sport and exercise psychology as is available in textbooks such as Cox, R.H. (2007). Sport Psychology: Concepts and Applications, 6th edition. Boston: McGraw-Hill, Biddle, S.J.H. & Mutrie, N. (2008). Psychology of Physical Activity: Determinants, well-being and interventions (2nd edition). New York, NY: Routledge, or Bakker, F.C. & Oudejans, R.R.D. (2012). Sportpsychologie. Nieuwegein: Arko Sports Media.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Electromyography

Vakcode	B_ELECTROMYO (900815)
Periode	Periode 5
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. J.H. van Dieen
Examinator	prof. dr. J.H. van Dieen
Docent(en)	prof. dr. J.H. van Dieen
Lesmethode(n)	Hoorcollege, Practicum, Computerpracticum
Niveau	400

Doel vak

- The student has a basic knowledge of electrophysiology and the background of electromyographical; signals;
- the student has a basic knowledge of the different ways; of collecting electromyographical data in various fields of application;
- the student can analyze EMG data for kinesiological use;
- the student can choose the appropriate method for collecting and analyzing EMG data in a kinesiological study;
- the student knows the possibilities and limitations of EMG data;
- the student can interpret EMG data in relation to motor control, force and fatigue;
- the student can identify contamination in EMG data and can apply methods to reduce its effects;
- the student knows the standards for reporting EMG data.

Inhoud vak

In this course, the students are introduced to the electrophysical background of electromyography (EMG). Subsequently, the course focuses on methodological aspects of EMG acquisition and analysis, addressing the potential of this method as well as its pitfalls.

Onderwijsvorm

lectures 6 x 2 hours

practical 2 x 3 hours

The lectures introduce the following topics:

- electrophysiology;
- motor control (motor unit recruitment and firing);
- instrumentation and electrodes;
- HD- EMG and spatio- temporal information;
- onset determination;
- amplitude estimation;
- force estimation;
- cocontraction and cross- talk;
- motor unit firing and decomposition;
- frequency content, conduction velocity and fatigue.

Practicals concern analyzing EMG data.

Toetsvorm

2 hours; written test with equally weighted open- ended questions

Literatuur

Research articles and lecture handouts to be made available before the course

Vereiste voorkennis

- knowledge of and skills in programming in MATLAB at the level described for example in 'Verwerken van digitale signalen'.
- basic knowledge and understanding of the physiology of muscles and their control.

Overige informatie

Maximum number of students: 40

Energy Flow Models

Vakcode	B_ENERFLOW (900675)
Periode	Periode 1
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. J.J. de Koning
Examinator	dr. J.J. de Koning
Docent(en)	dr. J.J. de Koning
Lesmethode(n)	Hoorcollege, Computerpracticum
Niveau	500

Doel vak

To provide the student with knowledge about energy flow models, and so to enable the student to apply this knowledge in the modelling of human endurance performance.

Inhoud vak

Research in which exercise physiology and biomechanics are combined as a 'toolbox' is apparently unique and successful. This course familiarizes the student with one branch of this approach. Energy flow models, based

on power equations, will be used to study performance determining factors in endurance sports. This course explains the technique of modelling, how parameter values are obtained from experiments and how simulations with the model can be done. The student will construct a model of an endurance athlete to study the effect of parameter values on performance in cycling, speed skating and running. The models will be made in MATLAB. Knowledge of MATLAB is necessary to be successful in this course.

Onderwijsvorm

Lectures and guided practical;
84 hours (from which 28 practical, 6 lecture, 2 exam and 48 self study).

Toetsvorm

Written examination and practical report (30%/70%).

Literatuur

A selection of articles and practical guide on Blackboard.

Vereiste voorkennis

900104: Biomechanica (Students are expected to have sufficient knowledge of this subject);

900215: Mechanische analyse van het menselijk bewegen (Students are expected to have sufficient knowledge of this subject)

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Entrepreneurship in Human Movement Sciences

Vakcode	B_ENTREPREN (65412020)
Periode	Periode 5
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. E. Masurel
Examinator	prof. dr. E. Masurel
Docent(en)	prof. dr. E. Masurel
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

Students obtain knowledge about and insight in the relevance of entrepreneurship and innovation for their own discipline. Students learn about the processes which are involved in the recognition and exploitation of opportunities, about creating economic and social value and about the nature and role of networks. In addition students gain knowledge of different entrepreneurial processes and the importance of valorization of findings and business ideas for a knowledge-based economy.

Inhoud vak

This course consists of two tracks: a theoretical track and a practical track. These two tracks run simultaneously.

In the first track you learn about entrepreneurship. Answers are found on questions such as: what is entrepreneurship? What defines an entrepreneur? What are entrepreneurial opportunities? What is the role of innovation in entrepreneurship? What is corporate social responsibility (CSR)? How can we judge the feasibility of entrepreneurial ambitions?

Simultaneously you work on an assignment (second track). In the first week of this course you search for an innovation in your own discipline (product, service, process etc.). Your choice must be approved by the lecturers. The first part of the assignment consists of a description of the innovation which you have chosen. Subsequently, you make a SWOT analysis and a network analysis of the innovation. Also a paragraph of CSR should be added. The final part of the assignment is your own feasibility study: how would you valorize the innovation to the market.

Onderwijsvorm

Lectures and workshops. Each week scientific lectures or practical workshops are given. These lectures are both the basis for the exam and for the assignment.

Toetsvorm

You conduct a written exam and an assignment. Both the exam and the assignment will determine 50% of the grade. The exam and the assignment must be of sufficient quality.

Literatuur

The course manual contains a list of online available articles.

Overige informatie

Optional course for Master students 'Human Movement Sciences' 'Sport, Exercise & Health', 'Fundamental and Clinical Movement Sciences'.

Exercise and Health

Vakcode	B_EXERHEALTH (900667)
Periode	Periode 3
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. T.M. Altenburg
Examinator	dr. T.M. Altenburg
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

The main objective of this course is to provide you with the necessary tools to write a research proposal targeting a public health problem.

By the end of this course you should be able to:

§ Systematically analyse a public health problem and its underlying behavioural and environmental determinants;

§ Evaluate an existing intervention study according to set

criteria;

§ Write a research proposal aimed at improving a public health problem;

§ Present and discuss your final research proposal.

Inhoud vak

The overall aim of this course is to enable you to write a research proposal targeting a public health problem.

Terminology to describe a public health problem, analysis of behaviour and its determinants (personal and environmental), intervention development, theories and models for change, intervention implementation and evaluation (effect, process and cost-effectiveness) are discussed in-depth such that you are able to write your research proposal.

Examples from current studies are evaluated to develop a critical mind on shortcomings in existing research.

Onderwijsvorm

This course will consist of lectures, seminars and a final (obligatory) presentation session.

Toetsvorm

You are required to produce a research proposal (60%) and presentation (40%). Both must be of sufficient quality to pass the course.

Literatuur

Vereiste voorkennis

Fundamental knowledge on statistical techniques is strongly advised.

Overige informatie

The last seminar is obligatory.

Health and Society

Vakcode	B_HEALTHSOC (900664)
Periode	Periode 1
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. M.C. de Bruijne
Examinator	dr. M.C. de Bruijne
Docent(en)	dr. M.B.M. Soethout, dr. M.C. de Bruijne, dr. M.H.H. Hoogsteder
Lesmethode(n)	Hoorcollege, Practicum
Niveau	500

Doel vak

The students are able to demonstrate knowledge and understanding of:

- the important determinants of health and disease in the general population;
- the goals, strategies and principles for health promotion in a general and specific population (primary, secondary and tertiary prevention);
- the fundamentals of different health systems and their goals and functioning in practice;
- priority setting and decision making in the development and implementation of public health programs.

Inhoud vak

Lectures will provide an introduction in the theory and practice of important topics in public health: health policy and care systems, health monitoring, and health prevention and promotion. These topics will be further illustrated and discussed in a case-oriented tutorial. Also a critical analysis of a public health report is discussed in a tutorial. The students (in couples) then select a topic of interest (e.g. development or implementation of a program for health promotion) for further study, presentation and a final paper.

Onderwijsvorm

- Lectures (3 x 2 hours and 1 x 3 hours), and tutorials (3 x 2 hours and 1 x 4 hours)

Toetsvorm

Structured paper & presentation on a self chosen public health topic.

Literatuur

We advise students to read the book: Gillam, Yates & Padmanabhan. Essential Public Health. Theory and Practice. Cambridge University Press 2007.

Obligatory papers: will be provided during the course.

Vereiste voorkennis

The students must be familiar with the content of the book: Gillam, Yates & Padmanabhan. Essential Public Health. Theory and Practice. Cambridge University Press 2007.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Overige informatie

Examination format structured paper, peer review of a paper and presentation.

Maximal Neuromuscular Performance

Vakcode	B_MAXNEUR ()
----------------	---------------------

Periode	Periode 1
Credits	3.0
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. C.J. de Ruiter
Examinator	dr. C.J. de Ruiter
Docent(en)	dr. C.J. de Ruiter
Lesmethode(n)	Hoorcollege
Niveau	400

Doel vak

The student has knowledge of the role of muscle activation and (changing) muscle properties on maximal human neuromuscular performance during high intensity exercise and the student has knowledge of the relevant research methods.

The student can apply this knowledge to questions regarding testing and improving of maximal neuromuscular performance in sports (and rehabilitation).

The student is able to evaluate the validity and relevance of basic scientific literature for neuromuscular performance in a sport (rehabilitation) related context.

The students will learn to critically read scientific papers on neuromuscular performance published in international journals. The student will be able to communicate ("translate") the implications of basic scientific knowledge of neuromuscular performance to practical issues raised by coaches and therapists in the field of sports (and rehabilitation).

Students will not learn how to do research, or how to test athletes, or how to design exercise programs in sports or rehabilitation etc.

Students will learn what underlying factors/mechanisms they should be aware of while designing muscle function tests and exercise programs.

Inhoud vak

During the course, a critical overview will be given of the current knowledge of maximal neuromuscular performance during relatively high intensity exercise of short duration (40 ms up to 5 min). Most examples will be provided from own research. The emphasis will be on the coupling between basic knowledge of muscle activation and (changing) muscle properties during human movement and their consequences for testing and training. This is a fundamental sports related muscle physiology course, not an applied sports course.

The following subjects will be addressed:

- Voluntary activation;
- Explosive force/power;
- Influence of temperature (incl. warm-up);
- Potentiation;
- (Low frequency) fatigue;
- Shortening deficit and lengthening force enhancement;
- Recruitment of motor units.
- Muscle oxygenation

Onderwijsvorm

The course will consist of a series of nine lectures condensed in a three week period (August 31st- September 18rd), during which relevant practical questions will be used as a starting point. Subsequently the focus will be on fundamental neuromuscular properties as studied in a series of accompanying scientific papers.

Toetsvorm

2 hours 15 minutes exam with open-ended questions in the week immediately following the three week lecture period (most likely on Wednesday September 23rd).

Literatuur

The course will mainly use research papers. Basic background information is derived from Chapters 1-10 of: Skeletal muscle: from molecules to movement. A textbook of muscle physiology for sport, exercise, physiotherapy and medicine. Jones, D.A., Round, J. and A. de Haan, Edinburgh: Churchill Livingstone, Elsevier Science Limited, 2004. ISBN 0 443 07427 5

Vereiste voorkennis

Sufficient knowledge of the basics of Muscle Physiology is absolutely necessary. In order to successfully participate, the students have to understand the following concepts: anatomy of skeletal muscle, sarcomere function, twitch, tetanus, length-force, force- and power-velocity, and stimulation frequency-force relations, the size principle of motor unit recruitment, rate coding, EMG, electrical stimulation, fibre type related differences in contractile properties, cross-bridge kinetics, excitation contraction coupling, the basic metabolic changes during exercise (changes in ATP and CrP, glycolysis, oxidative phosphorylation)

Normal and Abnormal Motor Development

Vakcode	B_MOTORDEVEL (900668)
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. A. Ledebt
Examinator	dr. A. Ledebt
Docent(en)	dr. A. Ledebt
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	400

Doel vak

Students should be able to identify, summarize, critically evaluate and expand upon topics regarding the development of perceptual-motor behavior in normal and populations at high-risk for abnormal motor development. Students are acquainted with different types of qualitative motor assessments and instruments to quantify motor performance. They are able to identify early alarm signals and describe the advantages and disadvantages of several tools to diagnose disorders involving motor problems. They are able to describe perceptual and motor problems of several developmental disorders (e.g. cerebral palsy, developmental coordination disorder).

Inhoud vak

The course deepens the understanding of normal and abnormal motor development and developmental disorders in fetuses, infants and young children. Lectures and tutorials provide insight into actual problems in the research and practice of perceptual-motor development, particularly

in the area of health sciences. The lectures present an overview of the developmental disorders in which motor problems are either defining characteristics (i.e., cerebral palsy) or form part of a larger spectrum of difficulties (i.e., autism, ADHD). Symptoms will be described and diagnostic criteria will be discussed. The main rehabilitation methods will be related to theories on development.

During tutorials the students learn to discriminate abnormal from normal movements in fetuses, infants and young children and are introduced to different types of measurement tools used to quantify motor performance.

Onderwijsvorm

Final written exam. Attending the tutorials and writing the reports linked to them are compulsory. The reports and the critical review have to be marked as "pass" by the lecturer.

9 lectures en 2 tutorials (2 hours each)

Toetsvorm

Final written exam with open-ended questions. Attending the tutorials is compulsory. The critical review has to be marked as "pass" by the lecturer.

Literatuur

Reader.

Vereiste voorkennis

Bases in neurophysiology and neuroanatomy.

Perception for Action

Vakcode	B_PERCACTION (900810)
Periode	Periode 4
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. J.B.J. Smeets
Examinator	prof. dr. J.B.J. Smeets
Docent(en)	prof. dr. J.B.J. Smeets
Lesmethode(n)	Hoorcollege, Computerpracticum
Niveau	500

Doel vak

The student is able to:

- describe the functioning of the sensory systems relevant for motor control;
- interpret scientific literature in the area of perception and apply it to the field of motor control.

Inhoud vak

The topic of this course is the question: how is sensory information processed to guide ones action? More specific: how do we know where a target and (a part of) our body is? The answers to these questions require knowledge about the sensory organs, their signals, and how these

signals are processed and combined in order to be used to control our actions. Each topic (e.g. proprioception, binocular vision) is introduced by a lecture, but the focus of the course is on the discussion of papers of the last decade. The discussion will be about both the phenomenology and the mechanisms.

Onderwijsvorm

Amount of contact hours:
 Lectures (' hoorcolleges') 7
 Tutorials (' werkcolleges') 7
 Assignments & self study 68
 Practicals 2

Each meeting will be a combination of tutorial consisting of a discussion of the previous assignment (1 hour), and a lecture introducing to the topic of the next assignment (1 hour)

In the practical, the students will compare two psychophysical techniques and discuss their effectiveness in answering the question what perceptual information is available.

Toetsvorm

After each lecture, students receive an assignment. Six of them have to be handed in before the next meeting. These assignments are graded, and count for 10 % of the final grade. The assignment after the final lecture will contribute 35 %: the remaining 5% on completion of the practical.

Literatuur

Literature needed for the course will be distributed during the course.

Vereiste voorkennis

No entry requirements. Basic knowledge of the nervous system is expected (e. g. function of various brain areas).

Overige informatie

- The maximum number of participants in this course is limited to 40

Perceptual-motor Learning

Vakcode	B_PERCML (900682)
Periode	Periode 2
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. G.J. van der Kamp
Examinator	dr. G.J. van der Kamp
Docent(en)	dr. G.J. van der Kamp
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

Knowledge and understanding: The student is capable of describing and summarizing the main tenets and concepts of contemporary theories of perceptual-motor learning (i.e., motor programming approach, common-

coding approach, neuropsychological approaches, ecological approach, dynamic systems and nonlinear pedagogical approach), including their experimental methods and the key empirical evidence supporting them. Applying knowledge and understanding: The student is capable of applying the knowledge and ideas emanating from contemporary theories of perceptual-motor learning to provide insight into existing habits and questions related to perceptual-motor learning in the practices of sports, rehabilitation and physical education.

Making judgments: The student is capable of critically assessing and evaluating the underlying assumptions and empirical evidence for the contemporary theories of perceptual-motor learning. The student is capable of evaluating the applied value of the contemporary theories for the practice of perceptual-motor learning in sports, rehabilitation and physical education. The student is capable of distinguishing between scientific theories and empirical facts on the one hand, and habits, routines and conventions in practice on the other.

Communication: The student is capable of presenting (orally and in writing) a concise summary of the main contributions of contemporary theories of perceptual-motor learning for applications in practice of sports, rehabilitation and physical education. The student is capable of contributing to discussions regarding the applied value of contemporary theories for the practice of sports, rehabilitation and physical education.

Inhoud vak

The course provides a capita selecta of contemporary theories of perceptual- motor learning, such as the motor programming approach, common-coding approach, neuropsychological approaches, the ecological approach and nonlinear pedagogy approach to perceptual-motor learning. Among others, the following topics will be addressed; variability of practice, video-feedback, self-controlled feedback, gaze-training, education of attention, anticipation, internal & external focus of attention, motor familiarity, observational learning, implicit & explicit learning, analogy learning, errorless learning, re-investment, constraints-led learning, transfer of learning. On the one hand, the course aims to deepen the understanding of contemporary theories and concepts with respect to learning of perceptual-motor skills. On the other hand, the course tries to bridge the gap between findings from theory-driven and experimental research and practices of training and (re-)learning of perceptual-motor skills in sports, rehabilitation and physical education.

Onderwijsvorm

Six lectures provide the student with an introduction into the contemporary approaches to perceptual- motor learning. The lectures give a short background to the theories and provide a critical discussion of the key concepts and empirical evidence. During the tutorials the students (in groups) apply the contemporary theories to the practice of perceptual- motor learning in sports, rehabilitation and physical education by proposing theory- derived solutions to 'problems from practice'. Finally, in the practical students practice a new perceptual motor skill, and use the learning experience to reflect upon the explanatory value and limitations of the scientific approaches to perceptual-motor learning. Lectures 12 hours, tutorials 10 hours practical 4 hours, self study 142 (preparation lectures etc. 80 hours and assessments 60 hours).

Toetsvorm

Written exam (open-end question) 50%;
Essay (50%),
Evaluation report (pass/no pass)

Literatuur

A collection of recent theoretical and experimental papers from the scientific literature (details to be announced).

Vereiste voorkennis

The student is familiar with the type of problems and questions that are addressed in theories and research of perceptual- motor coordination, control and learning. The student is able to independently search for, acquire and report knowledge from contemporary scientific papers.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Practical Internship

Vakcode	B_PRACINTERN (900680)
Periode	Ac. Jaar (september)
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. K. Levels

Doel vak

The course is intended to introduce students to a company, institute or organization with the aim of gaining insight into the way Human Movement Science can be applied within a company, institute or organization or otherwise be applied in such a way that the student can make an optimal impression for the sector concerned within the job market.

Inhoud vak

Practical internships can be taken at various companies, institutes or organizations, which is why there can be considerable differences regarding the content of the internship. Generally speaking students will receive a written assignment containing, in any case, what is expected of the student within the framework of the internship. The student is expected to become familiar with the activities within the company, institute or organization, as well as gaining insight into the role of their assigned department within the organization. This includes evaluating which Movement Sciences aspects are applied within in the department and which aspects could be applied in the future.

Research Internship

Vakcode	B_RI (900624)
Periode	Ac. Jaar (september)
Credits	24.0
Voertaal	Engels

Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Examinator	dr. D.L. Mann
Niveau	600

Doel vak

All Master students of Human Movements Sciences are required to complete their study with a research internship. The internship is meant to work both as an integrator, as well as a means for further specialization. An integrator, because all abilities and knowledge collected during previous studies, projects and courses will come together during the internship. Also, it is an option for further specialization, since the internship will give you the opportunity to develop research qualities on the subject or in the specialization, of your choice.

This manual is intended to function as a guide for planning, preparing and implementing the research internship and for writing the internship report. There is also a list of internship possibilities available. This list can be found on the Blackboard site bb.vu.nl.

Inhoud vak

The objective of a research internship is to obtain insight into the various components of the research process, as well as the cohesion between the various components. The intention being: how to phrase a question, formulate a hypothesis, prepare and perform experiments, classify data, interpret results (theory development) and write reports. Students are then able (under supervision) to apply this insight when preparing, performing and reporting on scientific research. This objective is mainly concerned with the technical aspects of scientific research. During the research internship you will also have varying, often valuable, experiences. You will experience what it is to plan a research project from start to finish and to independently implement it, and that working with others is an interesting and often educational experience and you can immerse yourself in a subject that interests you. You may also experience what can go wrong and how you react to such setbacks.

A research internship has to meet a number of requirements, which are formulated as follows:

1. The research is based on a subject that offers an adequate challenge
2. The research is performed in an ethically responsible way
3. The research is performed in a methodologically satisfactory manner
4. The research adds to, or is based on the theory valid for the scientific subject.

The length of the internship is 24 study points (EC). In exceptional cases this can be extended to 30 EC. The decision to invest 30 EC in the internship should be taken at the start of the internship and not post-hoc and there should be a clear reason for the extension (for example an extra assignment or the development of equipment).

The internship rapport has to adhere to a number of presentation and content demands, such as a special front page and a standard set-up. These demands can be found further down in this manual.

At this point there are no formal prior requirements for starting an internship, other than being registered as a Masters student in Human

Movement Sciences. However, Premaster students who are conditionally admitted to the programme can only start the internship when they completed the Premaster courses "Wiskunde", "Verwerken van Digitale Signalen" and "Meten van Fysische Grootheden". For some intern subjects it is strongly advised that you first follow specific courses from the Masters programme.

Onderwijsvorm

You are expected to conduct your research internship with a partner. Working with a partner has major advantages during the hands-on phase of the project, while having a sparring partner for discussion facilitates decision making during the full period of the internship.

A research internship usually follows the following phases:

1) determining the subject

First, you are assumed to check the Blackboard site for first orientation on a general subject and / or research direction. A list of subjects can be found on the list provided on Blackboard. An alternative route is to check which staff member, postdoc, or PhD student is involved in research subjects to your liking. It is without question allowed to contact them to inform about internship options.

In case you have serious difficulties deciding on who to contact or what to do, it is best to consult the master program coordinator: Dr. Koen Levels (k.levels@vu.nl). You may also propose your own subject, whereby you can consult the list of internship subjects to find some inspiration. In case you prefer to do your own subject, you need to discuss this with the coordinator at a very early stage as he or she must grant permission, which will at least be partially dependent upon finding a suitable supervisor.

As has been mentioned earlier, it is also possible to perform your internship outside the faculty or even abroad. In this case you are required to consult with the master program coordinator as it is important to make clear agreements about supervision. More information about what is involved in doing your internship abroad can be found on VU.net. It is strongly recommended that anyone anticipating doing an internship abroad should participate in an existing research project there. In this way you will profit from the knowledge already available at the foreign location. When you undertake your internship outside the faculty or abroad, you will always need a supervisor from the faculty (see point 2).

2) Supervision

All Master Internships, also those carried out outside the faculty, must be carried out under supervision of an academic staff member of the faculty. This supervisor has the final responsibility for the internship. Within two months after starting the internship, a research proposal has to be approved by the supervisor. The final products of the internship will be also be marked by a second assessor, but this usually is done after the internship draft report is completed. Your contacts as a student might only be limited to your supervisor during the internship. The second assessor is only obligatory involved with your research report behind the scenes. The role of this second assessor is that of an independent reviewer of the internship.

3) Preparing a proposal

Once the subject and the supervisors have been determined, a research

proposal must be prepared. The proposal should describe the aims, the approach and the theoretical framework within which the project is defined. In addition, in the plan you will have to formulate your research hypotheses and explain which experiments and statistical analyses you'll apply to test your hypotheses. Furthermore you must prepare a time plan and an overview of the equipment you will need (when this is applicable). Within the course "writing and designing a research proposal" which takes place in January, you have the opportunity to write a proposal for your research internship. Although it is not obliged to write the proposal for your internship during this course, it is strongly encouraged and can save you valuable time.

4) The ethical committee

Every research project needs approval of the Vaste Commissie Wetenschap en Ethiek (VCWE) of the faculty before the actual start of the project. In some cases the process can be limited to an extension of an already existing ethical approval, but it might be necessary to obtain approval for your specific project. In those cases where non-invasive experiments are performed, using healthy, adult volunteers, usually only the approval of the VCWE is sufficient. More information about this committee can be found on the FGB website.

The ethical committee application is ALWAYS the end responsibility of your supervisor. This means that he or she will have to sign and, if necessary, defend the application. If your project includes measurements on patients, or invasive measurements, approval from the Medical Ethical Committee of the VUmc, or another hospital will be necessary. In that case the procedure might be lengthy, up to several months.

5) General lay-out of an internship

Of course, the research internship is implemented according to your own work plan and the supervision agreement. But generally the implementation of an project can be divided into the following stages:

- An (extensive) read-up period
- Writing the research proposal
- Application for approval of the Ethical Committee
- Practice with measurement settings or instruments, and pilot experiments
- Making an exact plan for the research
- Collecting data
- Data processing
- Data analyses/statistics
- Interpretation of the results
- Write-up and presentation of results

It is recommended that you take into account the inevitable delay when preparing your planning. Make sure you have regular meetings with your supervisor; this can often be advantageous for your progress.

6) Writing the Report

The internship report should be presented as a scientific paper. It is, however, possible to deviate from this, depending on the project, project location and supervisor (for example by dividing it into chapters or by adding supplements). The report should follow the standard structure of a scientific paper. For a more detailed description on writing research papers see "Essentials of Writing Biomedical Research Papers" by Mimi Zeiger. Standard sections of a research report are:

- Abstract, keywords
- Introduction, including the research questions and the hypotheses
- Methods
- Results
- Discussion
- Conclusion
- References

The report is written in English. A Dutch summary can be added to the report when this is required by the institution, where the work is carried out.

The preferred style for referencing is the APA style for psycho-socially oriented manuscripts (see <http://www.apastyle.apa.org>). For more medical-biological oriented subjects, the preferred style is the Vancouver style. See the link to the site of the University of Queensland for more details on this style of referencing (<http://www.library.uq.edu.au/training/citation/vancouv.pdf>).

Referencing in the text can either be done following a numerical system, or by using author names. Decide together with your supervisor which style to follow.

7) Presentation of the Research

You are supposed to present your results after the report has been approved by your supervisor(s). At these presentations, you are requested to present your results following the standard scientific structure, and at a level that will make it understandable for a scientifically trained, but not necessarily specialized, audience. During the period in which you are conducting your research, you are obliged to be present at these Research Discussion Meetings. These meetings are not only obligatory, but are also very useful. It can work to your advantage to take note of what fellow students have to say about your research and/or the presentation. Besides this, it is also a good opportunity to meet students who are at the same stage in their research as you and who run into the same problems. Visiting Research Discussion Meetings is of course unrealistic when you do your internship abroad. It is, however, expected that you visit research meetings at the guest institution when applicable.

Supervision

During the implementation of your research internship you are entitled to approximately 100 hours of supervision time. Your supervisor is required to comment on and to return draft- and final versions within two weeks. It is important that you agree beforehand with your supervisor about when you will hand in your drafts and when these will be discussed. Obviously, these agreements are mutual: both parties are expected to adhere to the planning. By preparing a good plan with your supervisor and by writing down agreements in a supervision agreement (which can be found on the blackboard age) planning problems can be prevented. In the case that a dispute should arise with your supervisor, this can be taken up with the Coordinator of the Master Program: dr. Koen Levels. If the Coordinator also happens to be your research supervisor, you can turn to the Education Director (dr. Kirsten Bijker).

Toetsvorm

When assessing the research internship the supervisor and second assessor have to agree on the mark that is given. The mark consists of three components:

1. How the research was performed (assessed by the supervisor). This

takes into account the way in which measurements, organization, contact with test subjects, speed etc. are performed.

2. The report (assessed by the supervisor and the second assessor).

The report is assessed on the basis of content as well as of layout.

3. Presentation of the research (assessed by the supervisor and the second assessor). The mark is based on arrangement, composition and content of the presentation, clarity, use of audiovisual support and presentation technique etc.

The first component accounts for 40% of the final mark. The report accounts for 50%, and the final 10% is determined by the presentation of the research. The final mark is rounded off to the nearest half mark.

The supervisor and second assessor use the assessment form (last page of this document) to determine the final grade. All components have to be assessed with a pass. Research projects marks can differ between partners, as marks are given on an individual basis.

If you do your research internship in a foreign institution, the assessment follows slightly different rules: the local supervisor will be asked to mark your work attitude (1) and the report (2), but the final marking will be the responsibility of your 'home' supervisor. Of course, he or she will also be responsible for both the report and the presentation.

The final report has to be uploaded by every student on the blackboard page for a plagiarism check. So, even when you did your internship as a duo, both of you have to upload the report. Whether, and to which extent there might be a case of plagiarism will be to the judgment of the exam committee. Since plagiarism is considered as a serious offense to the scientific codes, any form of plagiarism might lead to serious sanctions. Consult the website for more detailed information on tasks and activities of the exam committee.

Evaluation

During one of the final meetings between you and your supervisor the internship process will be evaluated. The various components of the internship are discussed (getting started, measurements, writing the report etc). During these discussions you should be given the opportunity to express your feelings about the supervision. If, during the research, you are unhappy about the supervision, do not wait until the official evaluation meeting to air them, as not much else can be done at that stage but 'naming and shaming'. Keep in mind, however, that supervision is not a one-way process: you are also responsible for making a good supervision possible.

The electronic version of your report should be uploaded in pdf-format through the BB Research Internship Plagiarism Check entry. Please use the official front page and format. Not doing this might lead to unnecessary delays and extra work at a later stage.

Overige informatie

Uploading to the library data base

In 2009, the Faculty has started with the electronic archiving of reports in the official VU library data base. You have to upload your report on <http://www.uvvu.vu.nl> in order to get a grade for your report.

Short Literature Review

Vakcode	B_SLR (900601)
Periode	Ac. Jaar (september)
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Niveau	600

Doel vak

The aim of the Short Literature Review is to determine whether a student can formulate a research question and an objective answer to this question related to Human Movement Sciences based on peer-reviewed literature and is subsequently able to express these findings in a written report. Secondly, the Short Literature Review will serve as an evaluation of the student's skills in scientific writing. The Short Literature Review is an individual product.

Inhoud vak

The student chooses a subject related to Human Movement Sciences on which to write the Short Literature Review. The subject of the Short Literature Review should not be related to the subject of the Research Internship.

Onderwijsvorm

The student formulates a question related to Human Movement Sciences, which should be approved by a staff member of the department. In fore coming cases, the coordinator may allocate a supervisor, usually on the basis of the chosen subject and availability. At the start of the writing process, the student draws up a plan. This plan must contain a detailed presentation of the question for the Short Literature Review, a literature search strategy and a temporary classification (i. e. chapters or paragraphs). The student collects and selects relevant literature for the Short Literature Review and writes a report on the chosen subject. Regular consultation with the supervisor is recommended. The student is entitled to 12 hours of supervision. The completed Short Literature Review may be presented during a research meeting of one of the specializations.

Toetsvorm

If the student or supervisor feels that this is necessary a second opinion can be asked for.

Literatuur

Course manual Short Literature Review (available on Blackboard).

Overige informatie

The final version of the Short Literature Review has to be uploaded to the relevant Blackboard site for a plagiarism check. The electronic evaluation form has to be filled in before the mark can be registered by the study secretariat.

Special Topics in Sports Engineering

Vakcode	B_SPTOPICS ()
Periode	Periode 5
Credits	3.0

Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. H.E.J. Veeger
Examinator	prof. dr. H.E.J. Veeger
Docent(en)	prof. dr. H.E.J. Veeger
Lesmethode(n)	Werkcollege

Doel vak

After following this course, students should understand the complexity of maximizing sports performance and the importance of the inclusion of material – athlete interaction. More specifically, students should be:

- Familiar with the Power Equation concept and be able to apply this to cycling;
- Have knowledge of methodological aspects of sports research, in particular error propagation, man – machine interaction (closed loop complexity), measurement techniques, internal and external validity.
- Have insight in the organizational and psychological complexities of sports innovation.
- Able to measure key parameters needed for power equations, related to their own field and have experience in the measurement of key parameters in adjacent fields;
- Able to provide a cycling performance simulation programme with the parameters necessary to evaluate performance on a realistic level;
- Able to collect and present to fellow group members, data on parameters for such a simulation program.
- Present research findings through an individual portfolio, and a group presentation/poster/brief oral.

Inhoud vak

Special Topics in Sports Engineering is an inter-university course for Master students in Mechanical Engineering, Movement Sciences, Sport Sciences and other related MSc programmes. The course has been organised as a two-week intensive course, and comprises lectures, demonstrations, practicals, hands-on research and presentations. The course will be taught by staff from Delft University of Technology, Sheffield Hallam University and VU Amsterdam. The course is organised around a basic theme relevant for sports engineering. In 2014 – 2015 this theme will be "Maximizing cycling performance". During the course students will work out what aspects determine cycling performance, and collect data (through experiments or literature research) that are needed to develop / feed a simulation programme for the estimation of the optimal bike – rider combination and the maximal performance humanly possible.

Onderwijsvorm

Two weeks fulltime course

Toetsvorm

Portfolio:

1. Overview of scientific literature studied
2. Test results for at least one of the parameter collection experiments
3. Description of the parameter collection experiment
4. Printout of the presentation to the
5. The final simulation model

Literatuur

Will be provided during the course

Vereiste voorkennis

Basic knowledge of Matlab

Overige informatie

- This course is an interuniversity course given for both TU and VU students: regular travel is thus required;
- The course is organised as a two-week intensive course. Full availability during these two weeks is mandatory
- The maximum number of attendants = 20

Sport and Society

Vakcode	B_SPORTSOC (900665)
Periode	Periode 1
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. I.M. van Hilvoorde
Examinator	dr. I.M. van Hilvoorde
Docent(en)	dr. I.M. van Hilvoorde
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	500

Doel vak

The student:

- is able to understand and conceptualize sport as a social phenomenon
- has understanding and knowledge of the main sport sociological issues and controversies
- is able to translate these issues and understands its consequences for sports policy.
- is able to understand and apply theories that conceptualize the relations between technology and sport
- is trained in critical reading and evaluation of papers from a conceptual and sport sociological perspective

Inhoud vak

Students get acquainted with general theories about sports and society, and are able to apply these theories on the following key issues:

- The organization and evolution of sport
- Connections between sport and other spheres of social life (cf. education, public health)
- Connections and interdependencies between sport and globalization, commercialization, technology and the media
- Relations between sport success, heroism and national pride
- The question if sports and politics can and/or should be kept separate
- The way in which elite sport enforces cultural ideologies concerning human bodies and deviance (in particular in relation to human enhancement, doping or the boundary between “able bodies” and “disabled bodies”).

Onderwijsvorm

Amount of contact hours:

Lectures: 12 hours

Tutorials: 10 hours

Assessment: paper

Combination of Lectures and Tutorials

Toetsvorm

- paper/reviews

Literatuur

- Selection of relevant articles, lecture notes.

Vereiste voorkennis

Recommended background knowledge: Philosophy of sport.

Sport Psychology: from Evidence to Application

Vakcode	B_SPORTPSYEV ()
Periode	Periode 2
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. R.R.D. Oudejans
Examinator	dr. R.R.D. Oudejans
Docent(en)	dr. R.R.D. Oudejans, dr. R.I. Hutter, dr. R. Canal Bruland
Lesmethode(n)	Hoorcollege, Werkcollege, Bijeenkomst, Practicum
Niveau	500

Doel vak

The student is able to:

- give an overview of several psychological factors that play a role in sport, the assumed working mechanisms as well as ways of influencing these factors with mental training;
- give an overview of group dynamic processes in sport, theories on leadership and different coaching models.
- critically assess (recent) research literature in sport psychology on its thesis, content, empirical rigor and applicability;
- critically discuss (recent) research literature in sport psychology in a paper, culminating in the evaluation of the literature and a discussion of implications for sport (psychology) practice;
- critically assess and discuss papers of fellow students on contents, structure, writing and originality.
- link applied research to its theoretical background;
- discuss research on applied sport psychology;
- formulate advice in specific areas of applied sport psychology.

Furthermore, students will gain initial experience with applying mental training techniques and communication skills.

Inhoud vak

This course provides insight into research on (applied aspects) of sport psychology, particularly the areas of performance and social psychology. Performance Psychology focuses on research, theory, and practice intended to improve performance in sport. Social Psychology focuses on individual and group processes in sport settings. This area applies social psychological principles in examining factors related to the athletes, coaches and teams. Some of the topics that will be discussed are: performing under pressure, attentional control, motivation, as well as the broad topic of 'coaching' in sport, particularly group dynamics, leadership and coaching behaviours. In addition to the lectures, two practicals are organized, one to experience and apply 'performance profiling' and 'mental imagery', and one to experience and apply coaching models and communication skills. After the practicals students have to prepare and submit their practical reports. Finally, the content is for a large part determined individually as each student writes a paper on a key topic in sport psychology.

Onderwijsvorm

lectures: 10 times 2 hours

practicals: 2 times 3 hours

discussion meeting: 1 meeting 4 hours

There are several lectures on topics in sport psychology and two practicals. Students will produce an individual paper on a topic in sport psychology, write two practical reports in small groups, and (individual) reviews of the papers of their fellow students. The papers will be discussed in discussion meetings at the end of the course. Participation in both the practicals and one discussion meeting is compulsory for students.

Toetsvorm

Students produce a paper (60% of the final grade), two practical reports (together 25% of the final grade) and reviews about papers of other students (15% of the final grade). The paper, the practical reports as well as the reviews must at least be of sufficient quality to pass the course.

Literatuur

Vereiste voorkennis

Students should have basic knowledge and understanding of sport psychology as is available in textbooks such as Cox, R.H. (2007). *Sport*

Psychology: Concepts and Applications, 6th edition. Boston: McGraw-Hill, or Bakker, F.C. & Oudejans, R.R.D. (2012). Sportpsychologie. Nieuwegein: Arko Sports Media.

Statistics for Experimental Research

Vakcode	B_STATEXPRES (900683)
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. M.J.M. Hoozemans
Examinator	dr. M.J.M. Hoozemans
Docent(en)	dr. M.J.M. Hoozemans
Lesmethode(n)	Hoorcollege, Werkcollege, Computerpracticum
Niveau	400

Doel vak

On the basis of case descriptions and raw data the student is capable to:

- determine the research designs and choose, justify and perform the appropriate statistical analyses (t-tests or ANOVAs or their non-parametric counterparts) using SPSS.
- report the analyses and the results in the same way as is commonly done in methods and results sections of scientific journal articles.

Inhoud vak

Students will learn ins and outs of applying and interpreting statistical techniques that are common or are becoming common in experimental research. The topics covered in this course are:

- Research design
- Basic statistical principles (e.g. data exploration)
- Estimating a population mean from a sample
- Independent and paired t-tests and their associated confidence intervals
- Non-parametric difference tests
- Linear regression
- One-way ANOVA (between subjects and repeated measures)
- Factorial ANOVA (two-way between subjects, two-way repeated measures, two-way mixed design)
- Effect size
- Data transformations

There will be lectures and SPSS practical sessions for all the topics covered in the course.

Onderwijsvorm

Lectures (20 hours / 10 lectures)

Computer practicals (32 hours / 8 practicals)

Toetsvorm

The students have to take an examination. It will focus on t-tests, non-parametric difference tests, one-way ANOVA and factorial ANOVA.

Literatuur

Andy Field – Discovering Statistics using SPSS

Studentbegeleiding

Vakcode	B_STDBEG ()
Credits	6.0
Voertaal	Nederlands
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	drs. M.G.J. Buijtenweg
Examinator	drs. M.G.J. Buijtenweg

Talent Identification and Development

Vakcode	B_TALDEVEL (900672)
Periode	Periode 3
Credits	3.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. G.J.P. Savelsbergh
Examinator	prof. dr. G.J.P. Savelsbergh
Docent(en)	prof. dr. G.J.P. Savelsbergh
Lesmethode(n)	Hoorcollege
Niveau	400

Doel vak

Students are able to summarize and examine the implications of adopting a multi- disciplinary research perspective for the comprehensive study of talent development and identification, and identify and elaborate upon the limitations of existing (mono- disciplinary) research on talent identification and development (expert performance). Additionally, students are able to make recommendations for future research on understanding talent development and for implementing talent developmental programs.

Inhoud vak

In recent years, research on expertise and the identification and development of talent has tended to be mono- disciplinary. In the current course a multi- disciplinary approach is emphasized. The lectures discuss the environmental influences, but also deal with genetic issues and the interplay between the two from the various disciplines within human movements sciences among others, philosophy, psychology and physiology. The course addresses several issues, that all seem to play a part in talent identification and development. Like the amount of deliberate practice, the use of visual information, cognitive abilities, genetic make up or constraints, anthropometric characteristics, muscle structure and amount of fast and slow twitch muscle.

Onderwijsvorm

lecture

Six lectures provide the student with an introduction into the contemporary approaches to talent identification and development.

Toetsvorm

The course is concluded with a written test consisting of open- end questions.

Literatuur

A collection of recent theoretical and experimental papers from the scientific literature (details to be announced)

Vereiste voorkennis

None

Teacher Training at the Upper Secondary Level

Vakcode	B_DOCENTHBO ()
Periode	Ac. Jaar (september)
Credits	24.0
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Lesmethode(n)	Werkcollege

Doel vak

Binnen de verschillende accenten bestaat voor de student de mogelijkheid zich te profileren in de richting van het beroep docent. Hiertoe dient de docentenopleiding gevolgd te worden. Reeds vele afgestudeerden zijn werkzaam als docent in het hoger beroepsonderwijs (hbo), onder meer aan de opleidingen Fysiotherapie en Lichamelijke opvoeding. Daar geven zij, afhankelijk van de richting, theorie- en vaardigheidslessen in vakken als anatomie, (inspannings)fysiologie, (sport)psychologie, gezondheidskunde, methodologie en bewegingsanalyse, begeleiden zij tutorgroepen en/of afstudeerstages en zijn zij actief betrokken bij onderwijsontwikkeling.

Het doel van de docentenopleiding is dat de studenten de competenties van een beginnende docent verwerven. Zodat zij over kennis, inzicht, vaardigheden en attituden beschikken die hen in staat stellen als docent te functioneren en hun taken en taakuitvoering kritisch te evalueren en te veranderen.

Inhoud vak

Het opleidingsprogramma bestaat uit de volgende onderdelen: vier didactische cursussen, een professionaliseringstraject, een onderwijsinnovatieproject en een stage. De didactische cursussen zijn erop gericht de studenten kennis, inzichten, vaardigheden en attituden te verschaffen die nodig zijn voor het voorbereiden, uitvoeren en evalueren van onderwijs. Hierbij gaat het voornamelijk om het voorbereiden, verantwoorden en verzorgen van lessen (hoorcolleges, doceerlessen, werkgroepbegeleiding en vaardigheidslessen), het begeleiden van individuele studenten en het ontwikkelen en afnemen van toetsen. Het professionaliseringstraject biedt ondersteuning bij je ontwikkeling tot hbo-docent. Voor het onderwijsinnovatieproject voeren studenten in een projectgroep een opdracht van een hbo-instelling gericht op een onderwijsvernieuwing uit. De stage verschaft de studenten

kennis en inzicht in de onderwijs- en lesgeefpraktijk op een hbo-opleiding alsmede vaardigheid in het geven van onderwijs. De stage is het onderdeel van de docentenopleiding waarin integratie van de theorie in de praktijk plaatsvindt: vrijwel alle cursussen lopen vooruit op of grijpen terug naar activiteiten die studenten in de stage ondernemen. De stage loopt van september tot en met april. In overleg met de stage-instelling maakt de student een rooster waarin hij aangeeft wanneer hij (gemiddeld 1 dag in de week) op de instelling aanwezig is. Tijdens de stage dienen zowel lessen geobserveerd als gedoceerd te worden. Minimaal één les staat onder supervisie van de docentenopleiding en één les wordt vakinhoudelijk beoordeeld door een vakinhoudelijk deskundige docent. Daarnaast wordt onder begeleiding van de stage-instelling en de docentenopleiding, in de stage gewerkt aan een aantal opdrachten.

Overzicht van de studieonderdelen:

- didactische basisprincipes
- onderwijs aan groepen
- toetsen en beoordelen
- studentbegeleiding
- professionaliseringstraject
- onderwijsinnovatieproject
- stage

Onderwijsvorm

Binnen de didactische cursussen vindt thuis kennisoriëntatie plaats aan de hand van opdrachten. Tijdens de bijeenkomsten staat veelal de praktische toepassing centraal en werken de studenten aan de hand van oefeningen/opdrachten veel met elkaar samen in subgroepjes. Deze werkwijze maakt het noodzakelijk dat de studenten elke bijeenkomst bijwonen en actief participeren; aanwezigheid is verplicht.

Toetsvorm

Om de docentenopleiding af te ronden dient de student aan de hand van een beoordelingsportfolio en een beoordelingsgesprek te bewijzen de docentcompetenties op het niveau van een beginnend docent te bezitten. Hiertoe zal de student voldoende bewijslast moeten verzamelen. Kenmerkend voor deze toetsvorm is dat de verantwoordelijkheid meer bij de student komt te liggen, aangezien deze deels zelf bepaalt hoe en waarmee hij de verschillende competenties onderbouwt. Een aantal bewijsstukken is voorwaarde om de docentenopleiding af te ronden.

Literatuur

De boeken en de handleidingen worden verkocht tijdens de bijeenkomsten. De kosten bedragen ongeveer EUR 225,- en dienen voor het eind van de reguliere cursusduur betaald te worden.

Overige informatie

Het ministerie van OC&W heeft in de jaren 90 regelingen opgesteld inzake de benoembaarheidseisen voor docenten hbo. Een hbo-docent dient naast het bezit van een bewijs/verklaring van bekwaamheid (een getuigschrift van met goed gevolg afgelegd afsluitend examen Bewegingswetenschappen) ook in het bezit te zijn van een bewijs/verklaring van voldoende didactische voorbereiding. De benodigde didactische vaardigheden dient de docent op sommige hogescholen zelf te maken door het volgen van een didactische scholing (hbo-didactische cursus) nadat hij is aangesteld als docent binnen het hbo. Studenten die de docentenopleiding FBW met succes hebben afgerond wordt vrijstelling verleend voor de hbo-didactische cursus, mits zij niet langer dan vijf jaar na het afronden van de docentenopleiding met de hbo-didactische cursus beginnen. Geïnteresseerden die hun Master of Doctoraal reeds behaald hebben en

niet meer ingeschreven staan als student kunnen indien er plaats is aan de opleiding deelnemen als contractstudent. De kosten hiervoor worden geschat op € 2780,- te voldoen aan het begin van de opleiding. De docentenopleiding start in september en wordt afgesloten in mei. De vaste lesdag op de VU is de vrijdag.

Afhankelijk van de beschikbaarheid van externe stageplaatsen en de begeleidingsmogelijkheden is er een flexibele bovengrens in toelatingsplaatsen. Bij meer aanmeldingen dan plaatsen kan de docentenopleiding besluiten een toelatingsassessment te laten plaatsvinden.

Aanmelding dient schriftelijk te gebeuren vóór 1 mei op een daarvoor bestemd formulier. Voor een volledige beschrijving van het opleidingsprogramma wordt verwezen naar het leerplan. Dit leerplan en het aanmeldingsformulier zijn te vinden op

<http://www.exposz.nl/sport/docentenopleiding-fbw/>

Topics in Rehabilitation

Vakcode	B_TOPICS ()
Periode	Periode 1
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. T.W.J. Janssen
Examinator	prof. dr. T.W.J. Janssen
Docent(en)	dr. A. Ledebt, prof. dr. T.W.J. Janssen, dr. J.H.P. Houdijk, dr. E.E.H. van Wegen, prof. dr. G. Kwakkel
Lesmethode(n)	Hoorcollege, Practicum, Computerpracticum
Niveau	500

Doel vak

This course provides an overview of contemporary insights, methods and research questions in the field of rehabilitation from a human movement sciences perspective. The topics range from normal- and abnormal motor development in children to rehabilitation after physical or neurological impairments. After this course students should be able to identify, summarize, critically evaluate and expand upon topics regarding these issues.

Specifically, students get acquainted with different types of qualitative motor assessments, instruments and methods to quantify motor performance. The students become capable to understand the relevant issues, terms, concepts, mechanisms, and models in the restoration of mobility within the context of rehabilitation. They learn to appreciate and understand various aspects of motor development, functional recovery, adaptation, compensation, training and learning of function and activities in the framework of restoration of mobility in persons with neurological and musculoskeletal impairments. They understand the contexts, and the practical process of scientific research and communication in the combined fields of rehabilitation and human movement sciences. They also appreciate clinical decision making and acknowledge the importance of the ICF-framework in rehabilitation medicine.

Inhoud vak

During a part of this course, the understanding of normal and abnormal motor development and developmental disorders in fetuses, infants and young children is deepened. Lectures and tutorials provide insight into actual problems in the research and practice of perceptual-motor development, particularly in the area of health sciences. Disorders in which motor problems are either defining characteristics (i.e., cerebral palsy) or form part of a larger spectrum of difficulties (i.e., autism, ADHD) will be discussed and the main rehabilitation methods will be related to theories on development.

Being the key issue in physical rehabilitation of adults, this course sub-sequently concentrates on the 'restoration of mobility', and its underlying mechanisms, at the different levels of the International Classification of Functioning, Disability and Health (WHO 2001). Primarily a biophysical approach is taken: biomechanical, motor control and exercise (neuro)physiological principles, techniques and research findings will be discussed in specific patient populations, such as those with stroke, spinal cord injury, lower-limb amputation, Parkinson's disease, and multiple sclerosis. Aspects of functional recovery, neuroplasticity, adaptation, compensation as well as concepts of learning and training mechanisms will be addressed. Research in this field will be presented and discussed in the format of 'Capita Selecta'.

Onderwijsvorm

15 lectures of 2 hrs in which the current issues and state-of-the-art research in normal and abnormal motor development and in different patient populations is discussed; 2 site visits (4 hrs each) to rehabilitation centers Reade and Heliomare; 2 tutorials of 2 hrs. Attending the site visits and tutorials is compulsory. 6 2-hr meetings in which each student-pair gives a 15-minute lecture on a current rehabilitation topic. Each student should attend at least 3 of these meetings.

Toetsvorm

Multiple choice examination counting for 80% of the final grade. The mark for the lecture determines the remaining 20%.

Literatuur

A selection of scientific papers and a reader.

Vereiste voorkennis

Students should have basic knowledge and understanding of neurophysiology, neuroanatomy, biomechanics, and exercise physiology.

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.

Training, Aging and Disuse

Vakcode	B_TRAD ()
Periode	Periode 2
Credits	6.0
Voertaal	Engels
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	dr. R.T. Jaspers
Examinator	dr. R.T. Jaspers

Docent(en)	dr. H.L. Gerrits, dr. R.T. Jaspers
Lesmethode(n)	Hoorcollege, Werkgroep
Niveau	400

Doel vak

The purpose of the course Training, Aging and Disuse is to acquaint students with physiological and molecular/cytological principles that determine (peak) power and fatigue characteristics of skeletal muscle and how these are changed by exercise training, disuse and aging. The level of knowledge that should be attained in those disciplines will allow students to understand how particular physiological conditions will affect muscle function at different levels of organizations (i.e. from whole motor unit to molecular signals in the muscle cells).

Inhoud vak

Neuromuscular performance in terms of muscle peak power and maximal steady state power is impaired during aging and with a chronic decrease in usage, such as during bed rest, diseases, injuries, neuromuscular disorders and (most extreme) after a spinal cord injury. During the course, a critical overview is given of the current knowledge of short and long term adaptations of the neuromuscular system in response to training, aging, disuse and chronic disease, and how these relate to impaired muscle function. Underlying (molecular) processes leading to atrophy and reduced force generating capacity as well as a reduced endurance performance of the neuromuscular system are discussed. To obtain indications for how training or other interventions could effectively prevent these adverse effects and improve muscle function, a detailed overview is given of training induced changes in muscle phenotype and how these are related to molecular regulators of protein synthesis and degradation and mitochondrial biosynthesis. The content is mostly based on recent own research.

Onderwijsvorm

(20 hrs / 10 lectures, 4 hrs / 2 working lectures, 4 hrs / 2 practicals, 120 hrs preparation for contact hours and exam.

The course will consist of a series of lectures during which relevant questions are addressed and discussed. Using the literature assignments students should study the material independently (even though group work is encouraged) to attain a good understanding. In additional meetings relevant items are addressed in group discussions based on prepared questions/statements. Contact hours are intended to support that process and have the following goals:

- To accentuate importance of the content
- To place contents within a theoretical framework
- To identify content importance for the movement sciences
- To discuss content difficulties that may arise during independent study of assigned literature
- To practice solving problems using learned content.

In addition to the lectures, there are two laboratory practicals during which students get acquainted with measurement techniques of human muscle function in vivo and molecular analyses of gene expression and protein synthesis.

Toetsvorm

The course ends with a written test consisting of short essay questions.

- Book: Skeletal Muscle (SM)

D.A. Jones, J. Round, and A. de Haan. Skeletal Muscle from Molecules to Movement; A textbook of Muscle Physiology for Sport, Exercise, Physiotherapy and Medicine. Edinburgh: Churchill Livingstone, Elsevier Science Limited, 2004. ISBN 0 443 07427 5.

- In addition, the reading material consists of a number of scientific papers, which will be made available at Black Board.

Overige informatie

The student should have a basic knowledge and understanding of molecular biology, exercise and muscle physiology.

Writing and Designing a Research Proposal

Vakcode	B_WRITPROP ()
Periode	Periode 3
Credits	3.0
Faculteit	Fac. der Gedrags- en Bewegingswetensch.
Coördinator	prof. dr. A.M.L. Kappers
Examinator	prof. dr. A.M.L. Kappers
Docent(en)	prof. dr. A.M.L. Kappers, dr. K. Levels
Lesmethode(n)	Hoorcollege, Werkcollege
Niveau	400

Doel vak

This course aims to let students gain insight into the different aspects of preparing a research study and to develop the skills to write a research proposal. Students will learn which conditions must be met for a good research proposal. They will have to put this knowledge into practice by writing their own research proposal.

Inhoud vak

Writing a research proposal is not just about having a good idea, but also about motivating and clearly formulating a research question and substantiating the methods used to answer the research question. This skill is required when you conduct research, for example, during your research internship, but also if you want to submit a grant proposal or need to get approval for your study by a (medical) ethical committee. In this course, students will learn how to write a research proposal. Also the process of applying for a grant will be discussed. Experienced researchers will explain which elements of a proposal are important for reviewers. This also includes, for example, setting up your CV and considering ethical issues and societal relevance. These skills are required for and can be used in future (scientific) careers. The proposal can, if applicable, be used as preparation for the research internship, which will start in period 4, but that is not mandatory.

Onderwijsvorm

4 lectures (2 hours), 4 workgroups (2 hours), selfstudy
Active participation in workgroups, providing feedback

Toetsvorm

Complete research proposal in a prescribed format

Literatuur

Study manual

Intekenprocedure

For more info on workgroups, laboratories, (computer) practicals etc. please see Blackboard.
